

ABSTRACT

A set of conductor and an adapter-connector to allow easier process, reliable securing and guaranteed effective contact with its adapted electronic device is characterized by that the
5 conductor containing a main portion, a resilient arm and a conduction part; both of the resilient arm and the conduction part being extended in parallel from one end of the main portion; the resilient arm being further bent in opposite direction to extend for a certain length, then further bent for a certain angle; a contact
10 being provided on the resilient arm at a level higher than that of the top of the main portion.
